$\qquad$

## Economics 431

## Quiz \#2

Amy and Beth are competing sellers. Their price competition can be described by the following game, which is derived from the demand curve $Q=6-p$, where $p$ dollars per unit is the lowest price, and where the game's payoffs represent the sellers' daily profits, in thousands of dollars.

## Beth's Price

|  |  | \$1 | \$2 | \$3 | \$4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | \$1 | 2.50, 2.50 | 5.00, 0 | 5.00, 0 | 5.00, 0 |
| Amy's <br> Price | \$2 | 0, 5.00 | 4.00, 4.00 | 8.00, 0 | 8.00, 0 |
|  | \$3 | 0, 5.00 | 0, 8.00 | 4.50, 4.50 | 9.00, 0 |
|  | \$4 | 0, 5.00 | 0, 8.00 | 0, 9.00 | 4.00, 4.00 |

(a) Enumerate Amy's best response function:

If Beth chooses $\$ 1$, then Amy's best response is $\qquad$ \$1 _.

If Beth chooses $\$ 2$, then Amy's best response is $\qquad$ .
If Beth chooses $\$ 3$, then Amy's best response is $\qquad$ _.

If Beth chooses $\$ 4$, then Amy's best response is $\qquad$ \$3 .
(b) Does this game have a Nash equilibrium? $\qquad$
If so, describe one of the equilibria (what does each player choose?):
Each player chooses $\mathbf{\$ 1}$.

Describe how you know this is a Nash equilibrium:
It's a mutual best response.
